

NATIONAL RESERVE BANK OF TONGA

Monetary Policy Statement March 2008

Data finalized 20 March 2008

Monetary Policy Review

Economic activity in Tonga is likely to be contracted markedly in 2007, as the Kingdom's economy suffered following a poor agricultural season, the large-scale reduction in civil service workers and the near-destruction of Nuku'alofa's central business district. Reconstruction is taking a long time with only a few projects underway nearly 18 months following the civil disturbance of November 2006.

The National Reserve Bank of Tonga (NRBT) was active in encouraging economic activity throughout 2007. Early in the year credit ceilings were lifted, banks required reserves were reduced and the amount of liquidity in the banking system has been left at high levels. Consequently lending growth has recovered strongly. Even with business lending growth rates of nearly 30%, business activity has not returned to early 2006 levels.

Official foreign reserves have been maintained above 4 months of imports for 23 consecutive months. Remittances have picked up again following a slow patch in early 2007, and tourist receipts are growing strongly from a low base. However, imports are rising fast and with high world commodity prices we can expect import payments to continue to rise.

The Tongan Pa'anga (TOP) Nominal Effective Exchange Rate depreciated 1.8 percent over the year ended January. Continuing strength in the New Zealand and Australian dollars offset the pa'anga's appreciation against the United States dollar. In 2007 the pa'anga appreciated 7.4% against the USD mitigating the global rise in oil and food prices to some extent.

Inflation has risen again, reaching 10.6% in the year to January 2008, after averaging 5.8 percent in 2007. Imported inflation in the form of higher oil prices and imported food is the main culprit, but local firms are having to pass on higher input costs and significant rises in electricity, bread and vegetable prices are largely the result of high international fuel costs.

For the global economy, the long expansion enjoyed by most developed nations appears to be coming to an abrupt halt. The credit crises brought on by large scale defaults on loans in the United States is having far-reaching consequences. Growth in the United States is faltering and a period of very low growth, or even recession, is likely. China's outlook for economic growth rate has been pared back slightly, as it can expect lower exports to the United States. Nevertheless, China will still grow strongly and will take over as the main driver of world growth. Slower housing markets and higher retail interest rates in Australia and New Zealand are slowing growth there, but at this stage the economies are doing fine and inflation is the main concern of policy makers.

The US Federal Reserve and the Bank of England have both cut official interest rates, following intervention to ensure sufficient liquidity in their respective banking systems following the credit crisis, suggesting that financial turmoil is not over yet.

Table 1. Monetary Policy Indicators

Outlook

The outlook for the world economy has changed markedly in the last six months. The fallout from the credit crises in the United States and the United Kingdom has led forecasters to cut growth expectations everywhere. The United States is expected to grow slowly over the next few years, while the UK, eurozone, Australia, New Zealand and Japan can expect below-trend growth rates. China and India are still projected to once again show rapid growth though at slightly lower rates than in recent years.

Consumer price inflation is becoming a world-wide problem. Previously the growth in China and its rapid industrialization had kept prices from rising (in fact dropping prices) even while commodity prices of inputs rose. China now faces internal inflation of around 5%, and these costs are likely to be passed on to the buyers of China's output. Headline inflation in the United States, Australia and New Zealand have all surpassed 3% and with the United States cutting interest rates, inflation is unlikely to dissipate in the near term.

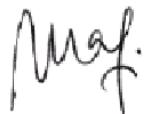

Oil prices rose above US\$100/barrel for the first time in early March and has generally remained at high level since. While slower industrial production in developed nations may reduce demand, ongoing growth in the developing world will likely see a floor kept under oil prices. Also, food price have been rising strongly as traditional crops are displaced for growing biofuels, at the same time as demand rises. Food prices have dropped slightly on world markets in recent times, but a return to the 'cheap' prices of a few years ago seems unlikely.

The outlook for activity is more positive, as we have already suffered our major growth downturn, and reconstruction activity will outweigh any impact from the slowing global economy on the small export sector. Even a return to normal levels of activity will be a significant pick-up for the Kingdom. Lending to the business sector suggests investment is taking place and hence confidence in the local economy. Aid received from Australia and New Zealand will give a further boost to investment activity once this is accessible.

This increased activity is likely to be concentrated in construction and related industries and lead to increased imports. An increase in imports will produce some downward pressure on foreign reserves if there is no increase in receipts to cover the expected higher payments. Also, upward pressure on prices is likely as materials for construction have risen in price over the past few years, and the demand for local products and labour rises. The recent strength in the pa'anga is expected to continue and curb some of the imported inflation effect, though this may mean a lower pa'anga valuation for our reserves. Inflation is a major concern over the next year, as oil prices remain high and the demand on local resources intensifies with expected reconstruction activity.

Given the financial position of many businesses, and the need for funding of business rebuilding, the Reserve Bank expects to maintain its current monetary policy stance for at least the next six months.

The Reserve Bank will continue to closely monitor developments in the banking system in order to promote internal and external monetary stability and promote a sound and efficient financial system.

Governor**

1. Maintain Adequate Foreign Reserves

Official Foreign Reserves

At the end of February, official foreign reserves stood at \$101.8 million, or 4.5 months of imports. This was the 23rd consecutive month that import cover has exceeded 4 months. Reserves have risen as remittances have re-established an upward trend, and import payments have been muted.

A \$13 million increase in the trade deficit over the year ended January (on an OET basis) was more than offset by a \$23 million increase in remittances. The Current Account deficit has narrowed considerably and when combined with an increase in capital inflows the overall balance has risen to \$27.7 million.

Imports have been rising strongly, though the amount paid for imports is still below early 2006 levels. This suggests that either large amounts of imports are actually remittances-in-kind, or the amount being paid for imports is lower than the declared value. Most likely the difference between payments and volumes shows an increase in remittances-in-kind.

Outlook

The outlook for foreign reserves is uncertain, and is likely to fall below 4 months of import cover but will remain above the adequate level of 3 months of imports in the next six months.

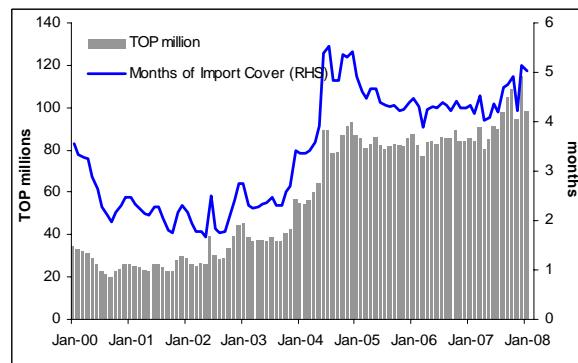

Private remittances picked up throughout 2007, and we expect this to continue throughout 2008, especially around the coronation in August. However, a poor economic outlook in the United States, Tonga's main source of remittances, may affect the amount sent from the US. In the past remittances have been demand-driven and not subject to variations in economic conditions, but a prolonged weakness in the US labour market will no doubt reduce the ability of people to send funds to Tonga. However, the success of the seasonal worker scheme in New Zealand should see an increase in remittances from New Zealand.

Imports are likely to increase over the next year. As the vast majority of materials for reconstruction projects will be imported we may see a reduction in the months of import cover, even if reserve levels are maintained. Some of this may be offset by capital inflows.

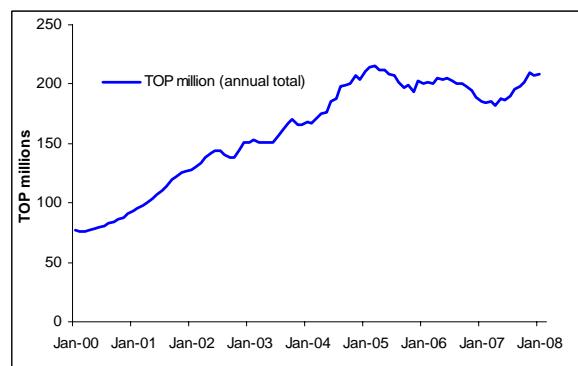

With continued price increases for imports such as oil and food the value of imports is likely to increase, and place further pressure on reserves.

Overall, the recently witnessed high rates of import cover in reserves are unlikely to be maintained, but despite a predicted rise in imports it is unlikely reserves will drop below adequate.

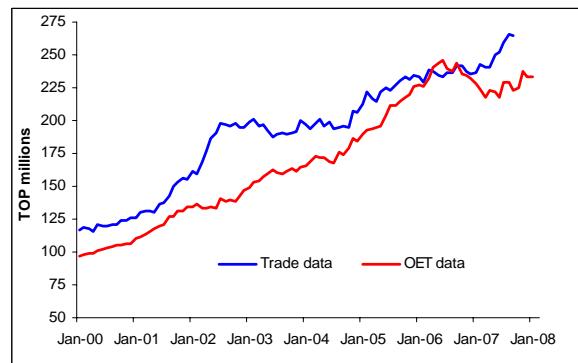

1.1 Official Foreign Reserves

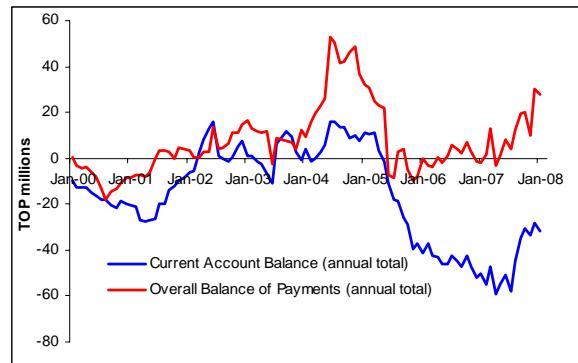

1.2 Remittances

1.3 Imports

1.4 Balance of Payments (OET estimate)

2. Promote Monetary Stability

Money Supply

The level of total broad money (M3¹) in the country has been rising since March when the Reserve Bank eased monetary policy.

Since April 2007 the Reserve Bank had left increasing levels of liquidity² in the market. Towards the end of 2007 and in early 2008, large payments for imports have reduced some of this liquidity, but the amount in the system remains adequate.

The sustained growth in M3 and the liquidity in the banking system have enabled credit growth to rise. In contrast to the housing-related credit boom of 2005/06, most new lending in the past year has been directed towards the business sector.

Interest Rates

Interest rates have been flat for the past six months, with only a slight rise in deposit rates recorded in January. However, banks have indicated that they are raising lending rates in April.

Some pockets of illiquidity have meant that banks are reportedly bidding high rates for institutional funds, though with no public data this can not be confirmed. Also, the lack of increases in retail deposit rates suggests that wholesale rates are not rising prohibitively high.

Outlook

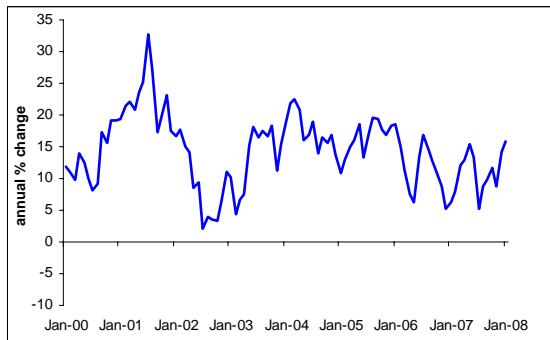

Credit growth will likely slow in the short-term as uncertainty over large import payments causes fluctuations in liquidity. However, as funds from the private sector recovery facility are made available (scheduled for early May) and reconstruction takes place business lending is likely to grow quickly again later in the year.

The Reserve Bank will continue to closely monitor developments in the banking system in order to promote external and financial system stability to ensure that confidence in the financial system is enhanced. In order to best facilitate this, the Reserve Bank projects that it will maintain its current monetary stance for at least the next six months.

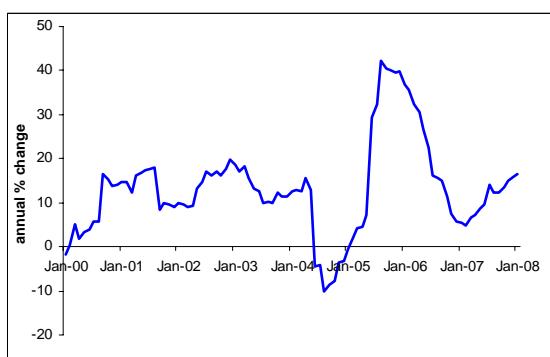

¹ M3 is all notes and coins in circulation, plus all money in bank accounts and term-deposits.

² Liquidity is the estimated cash available in the banking system.

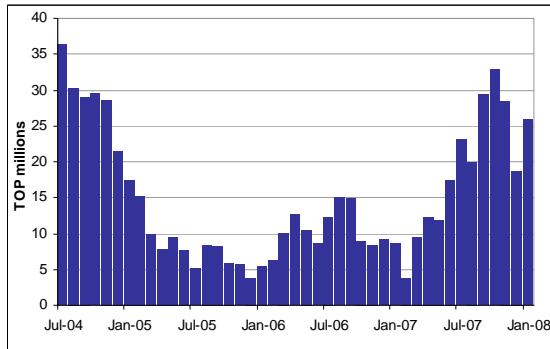

2.1 Money Supply (M3)

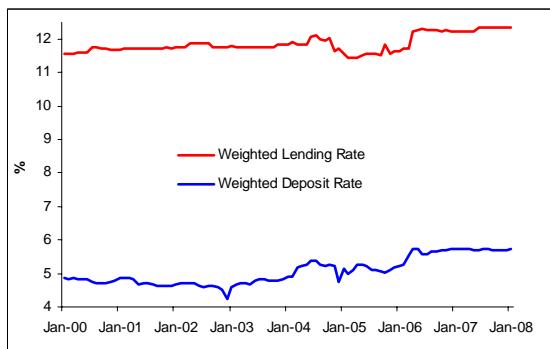

2.2 Private Sector Credit Growth

2.3 Banking System Liquidity

2.4 Retail Interest Rates

3. Promote Price Stability

Inflation

The second half of 2007 saw overall inflation relatively stable between 5% and 7%. However imported inflation rose from 5.4 to 8.2% during this time. Further, in January, a large oil price increase, plus rises in bread and electricity prices saw inflation jump to 10.6%

Domestic inflationary pressures had eased throughout 2007, but the second-round effects of large fuel price increases through the year were starting to get passed on in early 2008. Domestic inflation rose 7.6% in the year to January 2008, its fastest pace since 2006.

NEER

The Nominal Effective Exchange rate fell 1.8% in the year to January 2008, mostly due to depreciation of 6.5% against the AUD and 4.9% against the NZD. However over 2007 the pa'anga appreciated 7.4% against the USD, reflecting the overall weakness of the USD. The relative strength of the pa'anga, especially in the second half of the year, has reduced the amount of imported inflation from oil and food prices than would otherwise have been the case.

Outlook

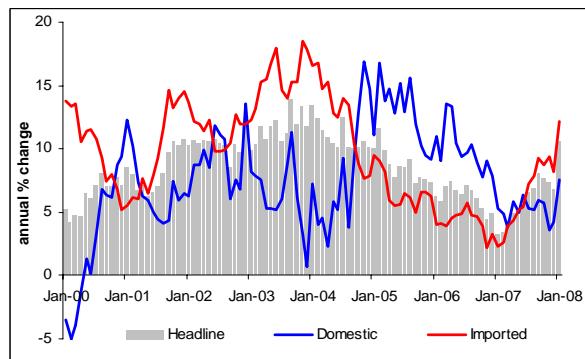

The high prices for oil and food, Tonga's main imports, will keep inflation high for some time. A weak USD is contributing to higher imported inflation pressure as it pushes the price of oil and industrial commodities higher (in USD terms). Also, food imported from countries with stronger currencies (such as New Zealand) becomes relatively dearer.

A continuation in the relative strength of the pa'anga will reduce imported inflation, but further rises in commodity prices will be translated into higher prices in Tonga.

A weaker Tongan economy will keep domestic inflation lower, though with firms and market sellers passing on higher fuel costs, prices will still be rising. Also, high inflation will encourage workers to seek higher wages, increasing the costs to business, potentially causing a wage-price spiral.

Overall, we can expect that price pressures will remain and vigilance will be required to keep inflation under control. Only a significant fall in oil prices or a drop in the currencies of our main import sources will see a dramatic fall in inflation.

Appendix 3. Monetary Policy Objectives

The NRBT's obligations with respect to monetary policy are laid out in Section 4 of the National Reserve Bank Act, 1988 and the National Reserve Bank of Tonga (Amendment) Act 2007 which state that the principal objectives of the Bank shall be to:

- (a) maintain internal and external monetary stability; and
- (b) promote a sound and efficient financial system;

Section 4 also states that the Reserve Bank will conduct its activities in a manner that supports macroeconomic stability and economic growth. In addition, Section 30 of the Act gives the Reserve Bank the responsibility of maintaining an adequate level of foreign exchange reserves.

The Reserve Bank believes that it can best meet its responsibilities relating to monetary policy by maintaining internal and external monetary stability through maintaining official foreign exchange reserves and promoting price stability. Maintaining an adequate level of foreign reserves is vital for a small open economy such as Tonga, which is dependent on imports for the supply of most of its goods which are paid for in foreign currency.

An adequate level of foreign reserves also minimises volatility in the exchange rate and provides confidence that businesses and individuals in Tonga are able to meet their foreign currency obligations. The Reserve Bank considers foreign reserves equivalent to at least 3 to 4 months of imports to be adequate.

Given the high component of imported goods in the CPI (66 percent), changes in the prices of imported goods and the exchange rate have a significant influence on the overall level of domestic prices.

Price stability contributes to economic welfare and sustainable economic development in many ways. Stable prices protect the purchasing power of the currency for consumers and savers. By protecting purchasing power, monetary policy also makes an important contribution to social cohesion, as the most vulnerable members of society are generally the least able to protect their savings against inflation. Moreover, inflation has the effect of transferring wealth from savers to debtors, as savers face a loss in the value of their assets, while the real value of debts diminishes as a result of inflation. Maintaining price stability prevents such arbitrary redistributions of wealth and income brought about by inflation.

Price stability also contributes to better economic performance. When inflation is low and stable it is easier for people to distinguish changes in relative prices and to adjust their decisions regarding consumption, saving, and investment accordingly. Importantly, an environment of stable prices also reduces risk in long-term financial agreements, as lenders and investors will be less likely to demand a high inflation risk premium to compensate for the loss of purchasing power. This reduces the costs to borrowers and increases the incentives for businesses to invest.

The high proportion of Tonga's exports and imports as a share of production mean that domestic prices are likely to move closely with the prices of traded goods, which in turn depends closely on the value of the exchange rate. Vulnerability to external shocks such as oil price increases, adverse weather conditions, high dependence on imports and remittances heighten the importance of promoting external stability, exchange rate stability and therefore overall price stability.

By promoting external stability through maintaining an adequate level of foreign reserves and promoting price stability, the NRBT through its conduct of monetary policy can most effectively contribute towards macroeconomic stability.
